Privacy policy

Privacy

We have written this privacy statement (version 11.03.2020-311160982) in order to provide you with the best possible information in accordance with the requirements of the General Data Protection Regulation (EU) 2016/679 explain what information we collect, how we use information, and what choices you have as a visitor to this website.

Unfortunately, it is in the nature of things that these explanations sound very technical, but we have tried to describe the most important things as simply and clearly as possible when creating them.

Cookies

Our website uses HTTP cookies to store user-specific data. Below we explain what cookies are and why they are used so that you can better understand the following privacy policy.

What exactly are cookies?

Whenever you browse the Internet, you use a browser. Popular browsers include Chrome, Safari, Firefox, Internet Explorer, and Microsoft Edge. Most websites store small text files in your browser. These files are called cookies.

One thing cannot be denied: Cookies are really useful little helpers. Almost all websites use cookies. More precisely, they are HTTP cookies, as there are other cookies for other applications. HTTP cookies are small files that are stored on your computer by our website. These cookie files are automatically placed in the cookie folder, effectively the "brain" of your browser. A cookie consists of a name and a value. When defining a cookie, one or more attributes must also be specified.

Cookies store certain user data about you, such as language or personal page settings. When you return to our site, your browser transmits the "user-related" information back to our site. Thanks to cookies, our site knows who you are and offers you your usual default setting. In some browsers, each cookie has its own file; in others, such as Firefox, all cookies are stored in a single file.

There are both first-party cookies and third-party cookies. First-party cookies are created directly by our site, third-party cookies are created by partner websites (e.g. Google Analytics). Each cookie must be evaluated individually, as each cookie stores different data. Also, the expiration time of a cookie varies from a few minutes to a few years. Cookies are not software programs and do not

contain viruses, Trojans or other "pests". Cookies also cannot access information on your PC.

For example, cookie data can look like this:

- Name: _ga
- Expiration time: 2 years
- Usage: Differentiation of website visitors
- Example value: GA1.2.1326744211.152311160982

A browser should support the following minimum sizes:

- A cookie should be able to contain at least 4096 bytes
- At least 50 cookies should be able to be stored per domain
- A total of at least 3000 cookies should be able to be stored

What are the types of cookies?

The question of which cookies we use in particular depends on the services used and is clarified in the following sections of the privacy policy. At this point, we would like to briefly discuss the different types of HTTP cookies.

We can distinguish 4 types of cookies:

Technical cookies

These cookies are necessary to ensure basic functions of the website. For example, these cookies are needed when a user adds a product to the shopping cart, then continues surfing on other pages and later goes to the checkout. Through these cookies, the shopping cart is not deleted even if the user closes his browser window.

Functional cookies

These cookies collect information about user behavior and whether the user receives any error messages. In addition, these cookies are also used to measure the loading time and the behavior of the website with different browsers.

Targeting cookies

These cookies provide a better user experience. For example, entered locations, font sizes or form data are stored.

Advertising cookies

These cookies are also called targeting cookies. They are used to deliver customized advertising to the user. This can be very convenient, but also very annoying.

Usually, when you visit a website for the first time, you are asked which of these cookie types you want to allow. And, of course, this decision is also stored in a cookie.

How can I delete cookies?

How and whether you want to use cookies, you decide. Regardless of which service or website the cookies come from, you always have the option to delete, only partially allow or disable cookies. For example, you can block third-party cookies, but allow all other cookies.

If you want to determine which cookies have been stored in your browser, if you want to change or delete cookie settings, you can find this in your browser settings:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

If you do not want to have cookies in principle, you can set up your browser so that it always informs you when a cookie is to be set. In this way, you can decide for each individual cookie whether you allow the cookie or not. The procedure varies depending on the browser. The best way is to search the instructions in Google with the search term "delete cookies Chrome" or "disable cookies Chrome" in case of a Chrome browser or exchange the word "Chrome" for the name of your browser, e.g. Edge, Firefox, Safari.

What about my privacy?

The so-called "Cookie Guidelines" have been in place since 2009. These state that the storage of cookies requires the consent of the website visitor (i.e. you). Within the EU countries, however, there are still very different reactions to these guidelines. In Germany, the Cookie Directives have not been implemented as national law. Instead, this directive was largely implemented in Section 15 (3) of the German Telemedia Act (TMG).

Storage of personal data

Personal data that you transmit to us electronically on this website, such as name, e-mail address, address or other personal information in the context of submitting a form or comments on the blog, will be used by us together with the time and IP address only for the purpose stated in each case, kept secure and not disclosed to third parties.

We thus use your personal data only for communication with those visitors who expressly request contact and for the processing of the services and products offered on this website. We do not disclose your personal data without consent, but we cannot exclude the possibility that this data may be viewed in the event of unlawful conduct.

If you send us personal data by e-mail - thus away from this website - we cannot guarantee secure

transmission and protection of your data. We recommend that you never send confidential data by e-mail without encryption.

According to Article 6 (1) a DSGVO (lawfulness of processing), the legal basis is that you give us consent to process the data you have entered. You can revoke this consent at any time - an informal email is sufficient, you will find our contact details in the imprint.

Rights under the General Data Protection Regulation

According to the provisions of the GDPR, you are generally entitled to the following rights:

- Right to rectification (Article 16 GDPR)
- Right to erasure ("right to be forgotten") (Article 17 GDPR)
- Right to restriction of processing (Article 18 GDPR)
- Right to notification - obligation to notify in connection with the rectification or erasure of personal data or the restriction of processing (Article 19 GDPR)
- Right to data portability (Article 20 GDPR)
- Right to object (Article 21 GDPR)
- Right not to be subject to a decision based solely on automated processing, including profiling (Article 22 GDPR)

If you believe that the processing of your data violates data protection law or your data protection rights have otherwise been violated in any way, you can contact the Federal Commissioner for Data Protection and Freedom of Information (BfDI)

Evaluation of the visitor behavior

In the following privacy policy, we inform you whether and how we evaluate data from your visit to this website. The evaluation of the collected data is usually anonymous and we can not conclude from your behavior on this website to your person.

You can find out more about how to object to this analysis of visit data in the following data protection declaration.

TLS encryption with https

We use https to transfer data tap-proof on the Internet (data protection through technology design Article 25(1) DSGVO). By using TLS (Transport Layer Security), an encryption protocol for secure data transmission on the Internet, we can ensure the protection of confidential data. You can recognize the use of this protection of data transmission by the small lock symbol at the top left of the browser and the use of the scheme https (instead of http) as part of our Internet address.

Google Maps Privacy Policy

We use Google Maps from Google Inc. (1600 Amphitheatre Parkway Mountain View, CA 94043, USA) on our website. Google Maps allows us to better visualize locations and thus improve our

service. By using Google Maps, data is transmitted to Google and stored on Google servers. Here we will now go into more detail about what Google Maps is, why we use this Google service, what data is stored and how you can prevent this.

What is Google Maps?

Google Maps is an online mapping service of the company Google Inc. With Google Maps you can search for exact locations of cities, sights, accommodations or companies on the Internet via a PC or via an app. If companies are represented on Google My Business, other information about the company is displayed in addition to the location. To show how to get there, map sections of a location can be integrated into a website via HTML code. Google Maps displays the earth's surface as a street map or as an aerial or satellite image. Thanks to the Street View images and the high-quality satellite images, very accurate representations are possible.

Why do we use Google Maps on our website?

All our efforts on this site are aimed at providing you with a useful and meaningful time on our website. By integrating Google Maps, we can provide you with the most important information about various locations. Thanks to Google Maps you can see at a glance where we are located. The directions always show you the best or fastest way to us. You can get the directions for routes by car, by public transport, on foot or by bike. For us, providing Google Maps is part of our customer service.

Which data is stored by Google Maps?

In order for Google Maps to fully offer its service, the company must record and store data from you. This includes the search terms entered, your IP address and the latitude and longitude coordinates. If you use the route planner function, the start address entered is also stored. However, this data storage happens on the websites of Google Maps. We can only inform you about this, but have no influence. Since we have integrated Google Maps into our website, Google sets at least one cookie (name: NID) in your browser. This cookie stores data about your user behavior. Google uses this data primarily to optimize its own services and to provide individual, personalized advertising for you.

The following cookie is set in your browser due to the integration of Google Maps:

- **Name:** NID
- **Duration:** after 6 months
- **Use:** NID is used by Google to customize ads to your Google searches. With the help of the cookie, Google "remembers" your most frequently entered search queries or your previous interaction with ads. This way, you will always get tailored ads. The cookie contains a unique ID that Google uses to collect personal settings of the user for advertising purposes.
- **Example value:** 188=h26c1Ktha7fCQTx8rXgLyATyITJ311160982

Note: We can not guarantee the completeness of the stored data. Especially with the use of cookies, changes at Google can never be ruled out. To identify the cookie NID, a separate test page was created, where only Google Maps was integrated.

How long and where is the data stored?

Google servers are located in data centers around the world. However, most servers are located in America. For this reason, your data is also increasingly stored in the USA. Here you can read exactly where the Google data centers are located: https://www.google.com/about/datacenters/inside/locations/?hl=en

Google distributes the data on different data carriers. This means that the data can be retrieved more quickly and is better protected against any attempts at manipulation. Each data center also has special emergency programs. For example, if there are problems with Google's hardware or a natural disaster affects the servers, the data is still very likely to remain protected.

Google stores some data for a set period of time. For other data, Google only offers the option to delete it manually. Furthermore, the company also anonymizes information (such as advertising data) in server logs by deleting part of the IP address and cookie information after 9 and 18 months, respectively.

How can I delete my data or prevent data storage?

With the automatic location and activity data deletion feature introduced in 2019, location and web/app activity information – will be stored for either 3 or 18 months depending on your decision – and then deleted. In addition, you can also manually delete this data from your history at any time via your Google account. If you want to completely prevent your location tracking, you need to pause the "Web and App Activity" section in Google Account. Click "Data and personalization" and then click the "Activity setting" option. Here you can turn the activities on or off.

In your browser, you can also deactivate, delete or manage individual cookies. Depending on which browser you use, this works in different ways. The following instructions show how to manage cookies in your browser:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

If you generally do not want cookies, you can set your browser so that it always informs you when a cookie is to be set. This way, you can decide for each individual cookie whether you allow it or not.

Google is an active participant in the EU-U.S. Privacy Shield Framework, which governs the accurate and secure transfer of personal data. You can find more information about this on https://www.privacyshield.gov/participant?id=a2zt000000001L5AAI. If you want to learn more about Google's data processing, we recommend that you read the company's in-house privacy policy at https://policies.google.com/privacy?hl=en.

Google Fonts Privacy Policy

We use Google Fonts from Google Inc. (1600 Amphitheatre Parkway Mountain View, CA 94043, USA) on our website.

You do not need to log in or enter a password to use Google Fonts. Furthermore, no cookies are stored in your browser. The files (CSS, fonts) are requested via the Google domains fonts.googleapis.com and fonts.gstatic.com. According to Google, the requests for CSS and fonts are completely separate from all other Google services. If you have a Google account, you do not need to worry that your Google account information, while using Google Fonts, will be transmitted to Google. Google records the usage of CSS (Cascading Style Sheets) and the fonts used and stores this data securely. We'll look at exactly what the data storage looks like in more detail.

What are Google Fonts?

Google Fonts (formerly Google Web Fonts) is an interactive directory of more than 800 fonts that use the Google LLC provides for free use.

Many of these fonts are released under the SIL Open Font License, while others are released under the Apache License. Both are free software licenses. Thus, we can use them freely without paying royalties.

Why do we use Google Fonts on our website?

With Google Fonts, we can use fonts on our own website, and not have to upload them to our own server. Google Fonts is an important component to keep the quality of our website high. All Google Fonts are automatically optimized for the web and this saves data volume and is a big advantage especially for mobile use. When you visit our site, the low file size ensures a fast loading time. Furthermore, Google Fonts are so-called secure web fonts. Different image synthesis systems (rendering) in different browsers, operating systems and mobile devices can lead to errors. Such errors can sometimes visually distort texts or entire web pages. Thanks to the fast Content Delivery Network (CDN), there are no cross-platform problems with Google Fonts. Google Fonts supports all major browsers (Google Chrome, Mozilla Firefox, Apple Safari, Opera) and works reliably on most modern mobile operating systems, including Android 2.2+ and iOS 4.2+ (iPhone, iPad, iPod).

We therefore use the Google Fonts so that we can present our entire online service as beautifully and consistently as possible. According to the Art. 6 para. 1 f lit. F DSGVO, this already constitutes a

"legitimate interest" in the processing of personal data. Legitimate interest" in this case means both legal and economic or ideal interests that are recognized by the legal system.

What data is stored by Google?

When you visit our website, the fonts are reloaded via a Google server. Through this external call, data is transmitted to the Google servers. In this way, Google also recognizes that you or your IP address is visiting our website. The Google Fonts API was developed to reduce the collection, storage, and use of end-user data to what is necessary for efficient font delivery. By the way, API stands for "Application Programming Interface" and serves, among other things, as a data transmitter in the software sector.

Google Fonts stores CSS and font requests securely at Google and is therefore protected. Through the collected usage figures, Google can determine the popularity of the fonts. Google publishes the results on internal analysis pages, such as Google Analytics. In addition, Google also uses data from its own web crawler to determine which websites are using Google fonts. This data is published in the Google Fonts BigQuery database. BigQuery is a web service from Google for companies that want to move and analyze large amounts of data.

It should be noted, however, that each Google Font request also automatically transmits information such as IP address, language settings, browser screen resolution, browser version and browser name to the Google servers. Whether this data is also stored cannot be clearly determined or is not clearly communicated by Google.

How long and where is the data stored?

Google stores requests for CSS assets for one day on your servers, which are mainly located outside the EU. This allows us to use fonts with the help of a Google stylesheet. A stylesheet is a format template that can be used to easily and quickly change, for example, the design or font of a web page.

The font files are stored by Google for one year. Google thus pursues the goal of fundamentally improving the loading time of web pages. When millions of web pages reference the same fonts, they are cached after the first visit and immediately reappear on all other web pages visited later. Sometimes Google updates font files to reduce file size, increase language coverage, and improve design.

How can I delete my data or prevent data storage?

The data that Google stores for one day or one year cannot simply be deleted. The data is automatically transmitted to Google when the page is called up. To be able to delete this data prematurely, you must contact Google support at https://support.google.com/?hl=en&tid=311160982 contact. Data storage you prevent in this case only if you do not visit our site.

Unlike other web fonts, Google allows us unlimited access to all fonts. So we can access an unlimited sea of fonts and get the most out of them for our website. You can find more about Google Fonts and other questions on https://developers.google.com/fonts/faq?tid=311160982. There, Google addresses privacy-related matters, but really detailed information about data storage is not included. It is relatively difficult (almost impossible) to get really precise information about stored data from Google.

You can also find out which data is generally collected by Google and what this data is used for on https://www.google.com/intl/de/policies/privacy/.

Google Fonts Local Privacy Policy

We use Google Fonts from Google Inc. (1600 Amphitheatre Parkway Mountain View, CA 94043, USA) on our website. Wir haben die Google-Schriftarten lokal, d.h. auf unserem Webserver – nicht auf den Servern von Google – eingebunden. Dadurch gibt es keine Verbindung zu Server von Google und somit auch keine Datenübertragung bzw. Speicherung.

What are Google Fonts?

Google Fonts (formerly Google Web Fonts) is an interactive directory of more than 800 fonts that the Google LLC provides for free use. With Google Fonts, you could use the fonts without uploading them to your own server. But in order to prevent any information transfer to the Google server in this regard, we have downloaded the fonts to our server. This way we act privacy compliant and do not send any data to Google Fonts.

Unlike other web fonts, Google allows us unlimited access to all fonts. So we can access an unlimited sea of fonts and get the most out of them for our website. You can find out more about Google Fonts and other issues at https://developers.google.com/fonts/faq?tid=311160982.

Google Analytics Privacy Policy

We use the analysis tracking tool Google Analytics (GA) of the American company Google LLC (1600 Amphitheatre Parkway Mountain View, CA 94043, USA) on our website. Google Analytics collects data about your actions on our website. For example, when you click on a link, this action is stored in a cookie and sent to Google Analytics. Using the reports we receive from Google Analytics, we can better tailor our website and service to your preferences. In the following, we will go into more detail about the tracking tool and, in particular, inform you about what data is stored and how you can prevent this.

What is Google Analytics?

Google Analytics is a tracking tool used for traffic analysis of our website. For Google Analytics to work, a tracking code is built into the code of our website. When you visit our website, this code records various actions you take on our website. Once you leave our website, this data is sent to the Google Analytics servers and stored there.

Google processes the data and we receive reports about your user behavior. These reports may include, but are not limited to, the following:

- Audience reports: Audience reports help us get to know our users better and know more precisely who is interested in our service.
- Ad reports: Ad reports help us analyze and improve our online advertising.
- Acquisition reports: Acquisition reports give us helpful information on how to attract more people to our service.
- Behavior reports: This is where we learn how you interact with our website. We can track the path you take on our site and which links you click.
- Conversion reports: Conversion is when you take a desired action based on a marketing message. For example, you go from being just a website visitor to a buyer or newsletter subscriber. These reports help us learn more about how our marketing efforts are working for you. This is how we aim to increase our conversion rate.
- Real-time reports: Here we always know immediately what is happening on our website. For example, we can see how many users are reading this text.

Why do we use Google Analytics on our website?

Our goal with this website is clear: we want to provide you with the best possible service. The statistics and data from Google Analytics help us achieve this goal.

The statistically evaluated data shows us a clear picture of the strengths and weaknesses of our website. On the one hand, we can optimize our site so that it is found more easily by interested people on Google. On the other hand, the data helps us to better understand you as a visitor. Thus, we know very well what we need to improve on our website in order to provide you with the best possible service. The data also helps us to carry out our advertising and marketing measures in a more individual and cost-effective way. After all, it only makes sense to show our products and services to people who are interested in them.

Which data is stored by Google Analytics?

Google Analytics uses a tracking code to create a random, unique ID associated with your browser cookie. This is how Google Analytics recognizes you as a new user. The next time you visit our site, you will be recognized as a "returning" user. All collected data is stored together with this user ID. This is how it is possible to evaluate pseudonymous user profiles..

Identifiers such as cookies and app instance IDs measure your interactions on our website. Interactions are all types of actions you take on our website. If you also use other Google systems (such as a Google account), data generated through Google Analytics may be linked to third-party cookies. Google does not share Google Analytics data unless we, as the website operator, authorize it. Exceptions may occur if required by law.

The following cookies are used by Google Analytics:

Name: _ga
Value:2.1326744211.152311160982-5
Purpose: By default, analytics.js uses the _ga cookie to store the user ID. Basically, it is used to distinguish the website visitors.
Expiration date: after 2 years

Name: _gid
Value:2.1687193234.152311160982-1
Purpose: The cookie is also used to distinguish the website visitors
Expiration date: after 24 hours

Name: _gat_gtag_UA_<property-id>
Value: 1
Purpose: Used to lower the request rate. When Google Analytics is deployed via Google Tag Manager, this cookie is named _dc_gtm_ <property-id>.
Expiration date: after 1 minute

Name: AMP_TOKEN
Value: not specified
Purpose: The cookie has a token that can be used to retrieve a user ID from the AMP client ID service. Other possible values indicate a logout, a request, or an error.
Expiration date: after 30 seconds or up to one year

Name: __utma
Value:1564498958.1564498958.1564498958.1
Purpose: This cookie can be used to track your behavior on the website and measure its performance. The cookie is updated every time information is sent to Google Analytics.
Expiration date: after 2 years

Name: __utmt
Value: 1
Purpose: The cookie is used to throttle the request rate like _gat_gtag_UA_<property-id>..
Expiration date: after 10 minutes

Name: __utmb
Value:3.10.1564498958
Purpose: Dieses Cookie wird verwendet, um neue Sitzungen zu bestimmen. Es wird jedes Mal aktualisiert, wenn neue Daten bzw. Infos an Google Analytics gesendet werden.
Expiration date: nach 30 Minuten

Name: __utmc
Value: 167421564
Purpose: This cookie is used to set new sessions for returning visitors. This is a session cookie and is only stored until you close the browser again.
Expiration date: After the browser is closed

Name: __utmz
Value: m|utmccn=(referral)|utmcmd=referral|utmcct=/
Purpose: The cookie is used to identify the source of traffic to our website. That is, the cookie stores from where you came to our website. This may have been another page or an advertisement.
Expiration date: after 6 months

Name: __utmv
Value: no information
Purpose: The Cookie is used to store custom user data. It is updated whenever information is sent to Google Analytics.
Expiration date: after 2 years

Annotation: This list cannot claim to be complete, as Google also changes the choice of its cookies time and again.

Here we show you an overview of the most important data collected with Google Analytics:

Heatmaps: Google creates so-called heatmaps. Via heatmaps you can see exactly those areas that you click on. This gives us information about where you are "on the road" on our site.

Session duration: Google defines session duration as the time you spend on our site without leaving. If you have been inactive for 20 minutes, the session ends automatically.

Bouncerate Bounce is when you view only one page on our website and then leave our website.

Registration: When you create an account or place an order on our website, Google Analytics collects this data.

IP-Address: The IP address is only shown in abbreviated form so that no clear assignment is possible.

Location: The IP address can be used to determine the country and your approximate location. This process is also called IP location determination.

Technical Information: Technical information may include your browser type, Internet service provider, or screen resolution.

Source of origin: Google Analytics respectively we are of course also interested in which website or which advertisement you came to our site from.

Other data include contact details, any ratings, playing media (e.g., when you play a video via our site), sharing content via social media, or adding to your favorites. The enumeration does not claim to be complete and only serves as a general orientation of the data storage by Google Analytics.

How long and where is the data stored?

Google has its servers spread all over the world. Most servers are located in America and consequently your data is mostly stored on American servers. Here you can read exactly where Google data centers are located: https://www.google.com/about/datacenters/inside/locations/?hl=en

Your data is distributed on different physical data carriers. This has the advantage that the data can be retrieved more quickly and is better protected against manipulation. In every Google data center, there are corresponding emergency programs for your data. If, for example, the hardware at Google fails or natural disasters paralyze servers, the risk of a service interruption at Google still remains low.

By default, Google Analytics sets a retention period of 26 months for your user data. Then your user data is deleted. However, we have the option to choose the retention period of user data ourselves. There are five variants available to us for this purpose:

- Deletion after 14 months
- Deletion after 26 months
- Deletion after 38 months
- Deletion after 50 months
- No automatic deletion

Once the specified period has expired, the data is deleted once a month. This retention period applies to your data associated with cookies, user recognition and advertising IDs (e.g. DoubleClick domain cookies). Reporting results are based on aggregated data and are stored separately from user data. Aggregated data is a merging of individual data into a larger unit.

How can I delete my data or prevent data storage?

Under European Union data protection law, you have the right to obtain information about your data, update it, delete it, or restrict it. Using the browser add-on to disable Google Analytics JavaScript (ga.js, analytics.js, dc.js), you can prevent Google Analytics from using your data. You can download the browser add-on at https://tools.google.com/dlpage/gaoptout?hl=en download and install. Please note that this add-on only disables data collection by Google Analytics.

If you generally want to disable, delete or manage cookies (independently of Google Analytics), there are separate instructions for each browser:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

Google Analytics is an active participant in the EU-U.S. Privacy Shield Framework, which governs the accurate and secure transfer of personal data. You can find more information about this on https://www.privacyshield.gov/participant?id=a2zt000000001L5AAI&tid=311160982. We hope we have been able to provide you with the most important information about Google Analytics data processing. If you want to learn more about the tracking service, we recommend these two links: http://www.google.com/analytics/terms/de.html and https://support.google.com/analytics/answer/6004245?hl=en.

Automatic data storage

Nowadays, when you visit websites, certain information is automatically created and stored, including on this website.

When you visit our website as you are doing right now, our web server (computer on which this website is stored) automatically stores data such as

- the address (URL) of the accessed web page
- browser and browser version
- the operating system used
- the address (URL) of the previously visited page (referrer URL)
- the host name and IP address of the device from which access is made
- the date and time

in files (web server log files).

As a rule, web server log files are stored for two weeks and then automatically deleted. We do not pass on this data, but we cannot rule out the possibility that this data may be viewed in the event of unlawful conduct.

Facebook Pixel Privacy Policy

We use the Facebook pixel from Facebook on our website. For this purpose, we have implemented a code on our website. The Facebook pixel is a snippet of JavaScript code that loads a collection of functions that allow Facebook to track your user actions if you came to our website via Facebook ads. For example, when you purchase a product on our website, the Facebook pixel is triggered and stores your actions on our website in one or more cookies. These cookies allow Facebook to match your user data (customer data such as IP address, user ID) with your Facebook account data. Then Facebook deletes this data again. The collected data is anonymous and not visible to us and can only be used in the context of ad placements. If you are a Facebook user yourself and are logged in, your visit to our website is automatically assigned to your Facebook user account.

We want to show our services or products only to those people who are really interested in them. With the help of Facebook pixels, our advertising measures can be better tailored to your wishes

and interests. Thus, Facebook users (if they have allowed personalized advertising) get to see suitable advertising. Furthermore, Facebook uses the collected data for analysis purposes and its own advertisements.

Below we show you those cookies that were set by embedding Facebook Pixel on a test page. Please note that these are only sample cookies. Different cookies are set depending on the interaction on our website.

Name: _fbp
Value: fb.1.1568287647279.257405483-6311160982-7
Purpose: This cookie is used by Facebook to display advertising products.
Expiration date: after 3 months

Name: fr
Value: 0aPf312HOS5Pboo2r..Bdeiuf...1.0.Bdeiuf.
Purpose: This cookie is used so that Facebook Pixel also works properly.
Expiration date: after 3 months

Name: comment_author_50ae8267e2bdf1253ec1a5769f48e062311160982-3
Value: Name des Autors
Purpose: This cookie stores the text and name of a user who leaves a comment, for example.
Expiration date: after 12 months

Name: comment_author_url_50ae8267e2bdf1253ec1a5769f48e062
Value: https%3A%2F%2Fwww.testseite...%2F (URL of the author)
Purpose: This cookie stores the URL of the website that the user enters in a text field on our website.
Expiration date: after 12 months

Name: comment_author_email_50ae8267e2bdf1253ec1a5769f48e062

Purpose: This cookie stores the user's email address if he/she has provided it on the website.
Expiration date: after 12 months

Annotation: The cookies mentioned above refer to individual user behavior. Especially with the use of cookies, Facebook changes can never be ruled out..

As long as you are logged in to Facebook, you can change your ad settings at https://www.facebook.com/ads/preferences/?entry_product=ad_settings_screenchange it yourself. If you are not a Facebook user, you can click http://www.youronlinechoices.com/de/praferenzmanagement/ basically manage your usage-based online advertising. There you have the option to deactivate or activate providers.

If you want to learn more about Facebook's privacy policy, we recommend you read the company's own data policy on https://www.facebook.com/policy.php.

Google Tag Manager Privacy Policy

For our website we use the Google Tag Manager of the company Google Inc. (1600 Amphitheatre Parkway Mountain View, CA 94043, USA). This tag manager is one of many helpful marketing products from Google. Through the Google Tag Manager, we can centrally incorporate and manage code sections from various tracking tools that we use on our website.

In this privacy policy, we want to explain in more detail what Google Tag Manager does, why we use it, and in what form data is processed.a

What is Google Tag Manager?

Google Tag Manager is an organizational tool that allows us to include and manage website tags centrally and through a user interface. Tags are small sections of code that, for example, record (track) your activities on our website. For this purpose, JavaScript code sections are inserted into the source code of our page. The tags often come from Google-internal products such as Google Ads or Google Analytics, but tags from other companies can also be included and managed via the manager. Such tags perform different tasks. They can collect browser data, feed marketing tools with data, embed buttons, set cookies and also track users across multiple websites.

Why do we use Google Tag Manager for our website?

As the saying goes: organization is half the battle! And of course this also applies to the maintenance of our website. In order to make our website as good as possible for you and all the people who are interested in our products and services, we need various tracking tools such as Google Analytics. The collected data from these tools show us what you are most interested in, where we can improve our services and which people we should still show our offers to. And for this tracking to work, we need to embed appropriate JavaScript codes into our website. In principle, we could include each code section of each tracking tool separately in our source code. However, this requires quite a lot of time and it's easy to lose track. That's why we use the Google Tag Manager. We can easily incorporate the necessary scripts and manage them from one place. Moreover, Google Tag Manager offers an easy-to-use interface and you don't need any programming skills. This is how we manage to keep order in our tag jungle.

What data is stored by Google Tag Manager?

The Tag Manager itself is a domain that does not set any cookies or store any data. It acts as a mere "manager" of the implemented tags. The data is collected by the individual tags of the different web analytics tools. The data is virtually passed through to the individual tracking tools in the Google Tag Manager and is not stored.

However, the situation is completely different with the embedded tags of the various web analysis tools, such as Google Analytics. Depending on the analysis tool, various data about your web behavior is usually collected, stored and processed with the help of cookies. For this, please read our privacy texts on the individual analysis and tracking tools that we use on our website.

In the Tag Manager account settings, we have allowed Google to receive anonymized data from us. However, this is only the use and usage of our Tag Manager and not your data stored via the code sections. We allow Google and others to receive selected data in anonymized form. We thus consent to the anonymous sharing of our website data. Which summarized and anonymous data is forwarded exactly, we could not find out - despite long research. In any case, Google deletes all information that could identify our website. Google combines the data with hundreds of other anonymous website data and creates user trends as part of benchmarking measures. Benchmarking compares our own results with those of our competitors. Processes can be optimized on the basis of the information collected.

How long and where is the data stored?

When Google stores data, this data is stored on Google's own servers. The servers are distributed all over the world. Most of them are located in America. Under https://www.google.com/about/datacenters/inside/locations/?hl=en you can read exactly where the Google servers are located.

How long the individual tracking tools store data from you can be found in our individual privacy texts for the individual tools.

How can I delete my data or prevent data storage?

The Google Tag Manager itself does not set cookies, but manages tags from various tracking websites. In our privacy texts for the individual tracking tools, you will find detailed information on how you can delete or manage your data.

Google is an active participant in the EU-U.S. Privacy Shield Framework, which governs the accurate and secure transfer of personal data. You can find more information about this on https://www.privacyshield.gov/participant?id=a2zt000000001L5AAI&tid=311160982. If you want to learn more about Google Tag Manager, we recommend you check out the FAQs at https://www.google.com/intl/en/tagmanager/faq.html.

Newsletter Privacy Policy

When you sign up for our newsletter, you submit the above personal data and give us the right to contact you by email. We use the data stored in the context of the registration for the newsletter exclusively for our newsletter and do not pass them on.

If you unsubscribe from the newsletter – you will find the link for this at the bottom of each newsletter – then we will delete all data that was stored with the registration to the newsletter.

Google AdSense Privacy Policy

We use Google AdSense on this website, the advertising program of Google Inc. (1600 Amphitheatre Parkway Mountain View, CA 94043, USA). Google AdSense allows us to display

advertisements on this website that match our theme. In this way, we offer you ads that ideally represent a real added value for you. In the course of this privacy policy on Google AdSense, we explain why we use Google AdSense on our website, what data from you is processed and stored, and how you can prevent this data storage.

The legal basis for the use of Google AdSense is Article 6 (1) f (lawfulness of processing), because there is a legitimate interest to carry out targeted advertising measures.

What is Google AdSense?

Google AdSense has been around since 2003 and is an advertising program from Google. In contrast to Google Ads (formerly: Google AdWords), you cannot place ads yourself. Google AdSense displays advertisements on websites, such as ours. The biggest advantage of this advertising service compared to some others is that Google AdSense only shows you ads that match our content. Google has its own algorithm that calculates which ads you will see. Of course, we only want to show you ads that you are interested in and that offer you added value. Google checks which ads are suitable for our website and for our users based on your interests or your user behavior and based on our offer. At this point, we would like to mention that we are not responsible for the selection of the advertisements. We only offer the advertising space with our website. The selection of the displayed advertising is made by Google. Since August 2013, the ads are also adapted to the respective user interface. This means that no matter whether you visit our website from your smartphone, your PC or laptop, the ads adapt to your end device.

Why do we use Google AdSense on our website?

Running a quality website requires a lot of dedication and great effort. Basically, we are never done with the work on our website. We always try to maintain our site and keep it as up to date as possible. Of course, we also want to achieve economic success with this work. That's why we decided to use advertisements as a source of income. However, the most important thing for us is not to disturb your visit on our website by these ads. With the help of Google AdSense you will only be offered ads that fit our topics and your interests.

Similar to Google indexing for a website, a bot examines the relevant content and offers on our website. Then, the ads are adjusted in terms of content and presented on the website. In addition to the content overlap between the ad and the website offer, AdSense also supports interest-based targeting. This means that Google also uses your data to offer advertising tailored to you. So you get advertising that ideally offers you real added value and we have a higher chance of earning a little something.

What data is stored by Google AdSense?

In order for Google AdSense to display customized advertising tailored to you, cookies are used, among other things. Cookies are small text files that store certain information on your computer.

In AdSense, cookies are intended to enable better advertising. The cookies do not contain any personally identifiable data. However, it should be noted that Google considers data such as “pseudonymous cookie IDs” (name or other identifier is replaced by a pseudonym) or IP addresses as non-personally identifiable information. However, in the context of the GDPR, this data may be considered personal data. Google AdSense sends a cookie to the browser after every impression (this is always the case when you see an ad), every click and every other activity that leads to a call to the Google AdSense servers. If the browser accepts the cookie, it is stored there.

Third-party vendors may place and read cookies on your browser as part of AdSense, or use web beacons to store data they obtain through ad delivery on the website. Web beacons are small graphics that enable log file recording and log file analysis. This analysis enables statistical analysis for online marketing.

Google may collect certain information about your user behavior on our website through these cookies. This includes:

- Information on how you interact with an ad (clicks, impression, mouse movements).
- Information whether an ad has already appeared in your browser at an earlier time. This data helps to avoid that an ad is shown to you more often.

In the process, Google analyzes and evaluates the data on the displayed advertising media and your IP address. Google uses the data primarily to measure the effectiveness of an ad and to improve the advertising offer. This data is not linked to personal data that Google may have about you via other Google services.

In the following, we present cookies that Google AdSense uses for tracking purposes. Here we refer to a test website that only has Google AdSense installed:

Name: uid
Expiration: after 2 months
Usage: The cookie is stored under the domain adform.net. It provides a uniquely assigned, machine -generated user ID and collects data about activity on our website.
Sample value: 891269189311160982

Name: C
Expiration: after 1 month
Usage: This cookie identifies whether your browser accepts cookies. The cookie is stored under the domain track.adform.net.
Sample value: 1

Name: cid
Expiration: after 2 months
Usage: This cookie is stored at the domain track.adform.net, stands for Client ID and is used to imp rove advertising for you. It can deliver more relevant ads to the visitor and helps improve campaign performance reports.
Sample value: 8912691894970695056,0,0,0,0

Name: IDE
Expiration: after 1 month
Usage: The cookie is stored under the domain doubkeklick.net. It is used to register your actions after the ad or after clicking on the ad. This allows us to measure how well an ad is received by our visitors.
Sample value: zOtj4TWxwbFDjaATZ2TzNaQmxrU311160982

Name: test_cookie
Expiration: after 1 month
Usage: With the help of the "test_cookies" you can check if your browser supports cookies at all. The cookie is stored under the domain doubkeklick.net.
Sample value: no information

Name: CT592996
Expiration: after 1 hour
Usage: Wird unter der Domain adform.net gespeichert. Das Cookie wird gesetzt sobald Sie auf eine Werbeanzeige klicken. Genauere Informationen über die Verwendung dieses Cookies konnten wir nicht in Erfahrung bringen.
Beispielwert: 733366
Annotation: This list cannot claim to be exhaustive, as experience has shown that Google also changes the choice of its cookies time and again..

How long and where is the data stored?

Google collects your IP address and various activities you perform on the website. Cookies store this information about interactions on our website. According to Google, the company collects and stores the specified information in a secure manner on Google's in-house servers in the USA.

If you do not have a Google account or are not logged in, Google stores the collected data with a unique identifier (ID) mostly on your browser. The unique IDs stored in cookies are used, for example, to ensure personalized advertising. If you are logged into a Google account, Google may also collect personal data.

You can delete some of the data that Google stores at any time (see next section). Much of the information stored in cookies is automatically deleted after a certain period of time. However, there is also data that is stored by Google for a longer period of time. This is the case when Google, due to economic or legal necessities, has to store certain data over an indefinite, longer period of time.

How can I delete my data or prevent data storage?

You always have the option to delete or disable cookies that are on your computer. How exactly this works depends on your browser.

Here you can find the instructions on how to manage cookies in your browser:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

If you do not want to have cookies in principle, you can set up your browser so that it always informs you when a cookie is to be set. This way you can decide for each cookie whether you allow the cookie or not. By downloading and installing this browser plug-in on https://support.google.com/ads/answer/7395996 all "advertising cookies" will also be disabled. Keep in mind that by disabling these cookies you do not prevent the advertisements, but only the personalized advertising.

If you have a Google account, you can visit the website https://adssettings.google.com/authenticated deactivate personalized advertising. Again, you will continue to see ads, but they will no longer be customized to your interests. Nevertheless, the ads are displayed based on a few factors such as your location (derived from your IP address), browser type, and search terms used.

You can find out what data Google basically collects and what they use this data for on https://www.google.com/intl/de/policies/privacy/.

Google Ads (Google AdWords) Conversion Tracking Privacy Policy

We use Google Ads (formerly Google AdWords) as an online marketing measure to promote our products, offers and services. In this way, we want to draw more people's attention to the high quality of our offerings on the Internet. As part of our advertising measures through Google Ads, we use the conversion tracking of Google LLC., 1600 Amphitheatre Parkway, Mountain View, CA 94043, USA (“Google”) on our website. With the help of this free tracking tool, we can adapt our advertising offer to your interests and needs much better. In the following article, we will go into more detail about why we use conversion tracking, what data is stored in the process and how you can prevent this data storage.

The legal basis for the use of Google Ads conversion tracking is Article 6 (1) f (lawfulness of processing), because there is a legitimate interest to carry out targeted advertising measures.

What is Google Ads conversion tracking?

Google Ads (formerly Google AdWords) is the in-house online advertising system of the company Google LLC. We can create online ads via Google Ads to bring interested people closer to our products or services. We are convinced of the quality of our offer and want as many people as

possible to get to know our website. In the online sector, Google Ads offers the best platform for this. Of course, we also want to get an accurate overview of the cost-benefit factor of our advertising campaigns. That's why we use the conversion tracking tool from Google Ads.

But what is a conversion actually? A conversion occurs when you go from being a purely interested website visitor to an active visitor. This happens whenever you click on our ad and subsequently perform another action, such as visiting our website. With Google's conversion tracking tool, we record what happens after a user clicks on our Google Ads ad. For example, we can see whether products are purchased, services are used or whether users have signed up for our newsletter.

Why do we use Google Ads conversion tracking on our website?

We use Google Ads to draw attention to our offer on other websites as well. The goal is to ensure that our advertising campaigns reach only those people who are interested in our products and services. With the conversion tracking tool we can see which keywords, ads, ad groups and campaigns lead to the desired customer actions. We see how many customers interact with our ads on a device or in a browser and then make a conversion. This data allows us to calculate our cost-benefit factor, measure the success of individual advertising measures, and consequently optimize our online marketing efforts. We can also use the data obtained to make our website more interesting for you and adapt our advertising offer even more individually to your needs.

What data is stored with Google Ads conversion tracking?

We have included a conversion tracking tag or code snippet on our website to better analyze certain user actions. If you now click on one of our Google Ads ads, the cookie "Conversion" is stored on your computer (mostly in the browser) or mobile device by a Google domain. Cookies are small text files that store information on your computer.

Here are the data of the most important cookies for conversion tracking by Google:

Name: Conversion
Expiration: after 3 months
Sample value: EhMI_aySuoyv4gIVled3Ch0llweVGAEgt-mr6aXd7dYlSAGQ311160982
Name: _gac
Expiration: after 3 months
Sample value: 1.1558695989.EAIaIQobChMIiOmEgYO04gIVj5AYCh2CBAPrEAAYASAAEgIYQfD_BwE

Annotation: The cookie _gac only appears in connection with Google Analytics. The above list is not exhaustive, as Google also uses other cookies for analytical purposes.

As soon as you complete an action on our website, Google recognizes the cookie and saves your action as a so-called conversion. As long as you surf our website and the cookie has not yet expired, we and Google recognize that you have found us via our Google Ads ad. The cookie is read and sent back to Google Ads with the conversion data. It is also possible that other cookies are used to measure conversions. The conversion tracking of Google Ads can be further refined and improved with the help of Google Analytics. For ads that Google displays in various locations

on the web, cookies named “__gads” or "_gac" may be set under our domain. Since September 2017, various campaign information from analytics.js is stored with the _gac cookie. The cookie stores this data as soon as you visit one of our pages for which the automatic tagging of Google Ads has been set up. Unlike cookies set for Google domains, Google can only read these conversion cookies when you are on our website. We do not collect or receive any personally identifiable information. We receive a report from Google with statistical evaluations. For example, we learn the total number of users who clicked on our ad and we see how well which advertising measure was received.

How long and where is the data stored?

At this point, we would like to point out that we have no influence on how Google uses the data collected by the conversion tracking tool. According to Google, the data is encrypted and stored on secure servers. In most cases, conversion cookies expire after 30 days and do not transmit any personal data. The cookies named "Conversion" and "_gac" (which is used in conjunction with Google Analytics) have an expiration date of 3 months.

How can I delete my data or prevent data storage?

You have the option not to participate in Google Ads conversion tracking. If you deactivate the Google conversion tracking cookie via your browser, you block conversion tracking. In this case, you will not be included in the statistics of the tracking tool. You can change the cookie settings in your browser at any time. This works slightly differently for each browser. Here you can find the instructions on how to manage cookies in your browser:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

If you do not want to have cookies in principle, you can set up your browser so that it always informs you when a cookie is to be set. This way you can decide for each cookie whether you allow the cookie or not. By downloading and installing this browser plug-in on https://support.google.com/ads/answer/7395996 all "advertising cookies" will also be disabled. Keep in mind that by disabling these cookies you do not prevent the advertisements, but only the personalized advertising.

Through the certification for the American-European data protection agreement “Privacy Shield”, the American corporation Google LLC must comply with the data protection laws applicable in the EU. If you would like to learn more about data protection at Google, we recommend the general privacy policy of Google: https://policies.google.com/privacy?hl=en.

Facebook privacy policy

We use selected Facebook tools from Facebook on our website. Facebook is a social media network of the company Facebook Ireland Ltd, 4 Grand Canal Square, Grand Canal Harbour, Dublin 2 Ireland. With the help of these tools, we can offer you and people who are interested in our products and services the best possible offer. In the following, we provide an overview of the various Facebook tools, what data is sent to Facebook and how you can delete this data.

What are Facebook tools?

Among many other products, Facebook also offers the so-called “Facebook Business Tools”. This is the official name of Facebook. However, since the term is hardly known, we have decided to simply call them Facebook Tools. Among them are:

- Facebook pixel
- social plug-ins (such as the "Like" or "Share" button)
- Facebook login
- account kit
- APIs (programming interface)
- SDKs (collection of programming tools)
- Platform integrations
- Plugins
- Codes
- Specifications
- Documentations
- Technologies and services

Through these tools, Facebook extends services and has the ability to obtain information about user activity outside of Facebook.

Why do we use Facebook tools on our website?

We only want to show our services and products to people who are really interested in them. With the help of advertisements (Facebook ads), we can reach precisely these people. However, in order to show users suitable ads, Facebook needs information about people's wishes and needs. Thus, information about user behavior (and contact data) on our website is made available to the company. As a result, Facebook collects better user data and can show interested people the appropriate advertising about our products or services. The tools thus enable tailored advertising campaigns on Facebook.

Data about your behavior on our website is called "event data" by Facebook. This is also used for measurement and analysis services. Facebook can thus create "campaign reports" on our behalf about the impact of our advertising campaigns. Furthermore, analytics give us better insight into how you use our services, website or products. As a result, we use some of these tools to optimize

your user experience on our website. For example, social plug-ins allow you to share content on our site directly on Facebook.

What data is stored by Facebook tools?

By using individual Facebook tools, personal data (customer data) can be sent to Facebook. Depending on the tools used, customer data such as name, address, phone number and IP address may be sent.

Facebook uses this information to match the data with their own data that they have from you (if you are a Facebook member). Before customer data is transferred to Facebook, a process called "hashing" takes place. This means that a data record of any size is transformed into a string of characters. This also serves to encrypt data.

In addition to contact data, "event data" is also transmitted. Event data" refers to the information that we receive about you on our website. For example, which subpages you visit or which products you buy from us. Facebook does not share the information it receives with third parties (such as advertisers) unless it has explicit permission or is legally required to do so. "Event data" may also be associated with contact information. This allows Facebook to offer better personalized advertising. After the matching process already mentioned, Facebook deletes the contact data again.

In order to deliver ads in an optimized manner, Facebook uses Event Data only when it has been aggregated with other data (collected by Facebook in other ways). Facebook also uses this event data for security, protection, development, and research purposes. Much of this data is transferred to Facebook via cookies. Cookies are small text files used to store data or information in browsers. Depending on the tools you use and whether you are a Facebook member, different numbers of cookies are created in your browser. We go into more detail about individual Facebook cookies in the descriptions of each Facebook tool. You can also find general information about the use of Facebook cookies on https://www.facebook.com/policies/cookies.

How long and where is the data stored?

Basically, Facebook stores data until it is no longer needed for its own services and Facebook products. Facebook has servers all over the world where your data is stored. Customer data, however, is deleted within 48 hours after it has been matched with your own user data.

How can I delete my data or prevent data storage?

In accordance with the Basic Data Protection Regulation, you have the right to information, correction, transferability and deletion of your data.

A complete deletion of the data will only occur if you delete your Facebook account completely. And this is how deleting your Facebook account works:

1) Click Settings on the right side of Facebook.

2) Then click on "Your Facebook information" in the left column.

3) Now click "Deactivation and deletion".

4) Now select "Delete account" and then click "Next and delete account".

5) Now enter your password, click "Next" and then "Delete account".

The storage of data that Facebook receives via our site takes place, among other things, via cookies (e.g. for social plugins). In your browser, you can deactivate, delete or manage individual or all cookies. Depending on which browser you use, this works in different ways. The following instructions show how to manage cookies in your browser:

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

If you generally do not want cookies, you can set your browser so that it always informs you when a cookie is to be set. This way, you can decide for each individual cookie whether you allow it or not.

Facebook is an active participant in the EU-U.S. Privacy Shield Framework, which governs the accurate and secure transfer of personal data. You can find more information about this on https://www.privacyshield.gov/participant?id=a2zt0000000GnywAAC. We hope we have brought you closer to the most important information about the use and data processing by Facebook tools. If you want to learn more about how Facebook uses your data, we recommend that you read the data policies on https://www.facebook.com/about/privacy/update.

Instagram privacy policy

We have integrated Instagram functions on our website. Instagram is a social media platform of the company Instagram LLC, 1601 Willow Rd, Menlo Park CA 94025, USA. Instagram has been a subsidiary of Facebook Inc. since 2012 and is one of the Facebook products. Embedding Instagram content on our website is called embedding. This allows us to show you content such as buttons, photos or videos from Instagram directly on our website. When you call up web pages on our website that have an Instagram function integrated, data is transmitted to Instagram, stored and processed. Instagram uses the same systems and technologies as Facebook. Your data is thus processed across all Facebook companies.

In the following, we want to give you a more detailed insight into why Instagram collects data, what kind of data it is and how you can largely control the data processing. Since Instagram belongs to Facebook Inc., we obtain our information from the Instagram policies on the one hand, but also from the Facebook data policies themselves on the other hand.

What is Instagram?

Instagram is one of the most popular social media networks in the world. Instagram combines the advantages of a blog with those of audiovisual platforms like YouTube or Vimeo. You can upload photos and short videos on "Insta" (as many of the users casually call the platform), edit them with various filters and also distribute them on other social networks. And if you don't want to be active yourself, you can just follow other interesting users.

Why do we use Instagram on our website?

Instagram is the social media platform that has really gone through the roof in recent years. And of course we have also responded to this boom. We want you to feel as comfortable as possible on our website. That's why a varied preparation of our content is a matter of course for us. Through the embedded Instagram features, we can enrich our content with helpful, funny or exciting content from the Instagram world. Since Instagram is a subsidiary of Facebook, the data collected can also serve us for personalized advertising on Facebook. This way, only people who are really interested in our products or services receive our ads.

Instagram also uses the collected data for measurement and analytics purposes. We get aggregate statistics and thus more insight about your likes and interests. It's important to note that these reports do not identify you personally.

What data does Instagram store?

When you come across one of our pages that have Instagram features (such as Instagram images or plug-ins) built in, your browser automatically connects to Instagram's servers. In the process, data is sent to Instagram, stored and processed. And this is regardless of whether you have an Instagram account or not. This includes information about our website, about your computer, about purchases made, about advertisements you see and how you use our offer. Furthermore, the date and time of your interaction with Instagram is also stored. If you have an Instagram account or are logged in, Instagram stores significantly more data about you.

Facebook distinguishes between customer data and event data. We assume that this is exactly the same for Instagram. Customer data is, for example, name, address, phone number and IP address. It is important to mention that these customer data are only transmitted to Instagram if they have been "hashed" beforehand. Hashing means that a data record is transformed into a string. This allows you to encrypt the contact data. In addition, the "event data" mentioned above is also transmitted. By "event data" Facebook - and consequently Instagram - understands data about your user behavior. It may also happen that contact data is combined with event data. The collected contact data is matched with the data that Instagram already has from you.

Via small text files (cookies), which are usually set in your browser, the collected data is transmitted to Facebook. Depending on the Instagram functions used and whether you have an Instagram account yourself, different amounts of data are stored.

We assume that on Instagram the data processing works the same as on Facebook. This means that if you have an Instagram account or www.instagram.com Instagram has set at least one cookie. If this is the case, your browser sends information to Instagram via the cookie as soon as you come into contact with an Instagram function. After 90 days at the latest (after matching), this data is deleted again or anonymized. Although we have intensively studied Instagram's data processing, we cannot say exactly what data Instagram collects and stores.

Below we show you cookies that are set in your browser at least when you click on an Instagram feature (such as button or Insta image). In our test, we assume that you do not have an Instagram account. Of course, if you are logged in to Instagram, significantly more cookies are set in your browser.

These cookies were used in our test:

Name: csrftoken
Value: “”
Purpose: This cookie is most likely set for security reasons, to prevent falsification of requests. However, we could not find out more about this.
Expiration date: after 1 year

Name: mid
Value: “”
Purpose: Instagram sets this cookie to optimize its own services and offers on and off Instagram. The cookie sets a unique user ID.
Expiration date: after closing your browser

Name: fbsr_311160982124024
Value: no Information
Purpose: This cookie stores the log-in request for users of the Instagram app.
Expiration date: after closing your browser

Name: rur
Value: ATN
Purpose: This is an Instagram cookie that ensures functionality on Instagram.
Expiration date: after closing your browser

Name: urlgen
Value: “\”194.96.75.33\”: 1901:1iEtYv:Y833k2_UjKvXgYe311160982”
Purpose: This cookie is used for Instagram's marketing purposes.
Expiration date: after closing your browser

Annotation: We cannot make any claim to completeness here. Which cookies are set in individual cases depends on the embedded functions and your use of Instagram.

How long and where is the data stored?

Instagram shares the information it receives between Facebook companies with external partners and with people you connect with around the world. The data processing is done in compliance with its own data policy. Your data is distributed, among other things for security reasons, on Facebook servers around the world. Most of these servers are located in the USA.

How can I delete my data or prevent data storage?

Thanks to the Basic Data Protection Regulation, you have the right of access, portability, rectification and deletion of your data. You can manage your data in the Instagram settings. If you want to completely delete your data on Instagram, you must permanently delete your Instagram account.

And this is how the deletion of the Instagram account works:

First, open the Instagram app. On your profile page, go down and click on "Help section". Now you will get to the company's website. On the webpage, click "Manage account" and then click "Delete your account"..

When you delete your account entirely, Instagram deletes posts such as your photos and status updates. Information that other people have shared about you does not belong to your account and consequently will not be deleted.

As mentioned above, Instagram stores your data primarily via cookies. You can manage, disable or delete these cookies in your browser. Depending on your browser, the management always works a bit differently. Here we show you the instructions for the most important browsers.

Chrome: Delete, enable and manage cookies in Chrome

Safari: Managing cookies and website data with Safari

Firefox: Delete cookies to remove data that websites have placed on your computer

Internet Explorer: Delete and manage cookies

Microsoft Edge: Delete and manage cookies

You can also basically set up your browser so that you are always informed when a cookie is to be set. Then you can always decide individually whether you want to allow the cookie or not.

Instagram is a subsidiary of Facebook Inc. and Facebook is an active participant in the EU-U.S. Privacy Shield Framework. This framework ensures proper data transfer between the U.S. and the

European Union. Athttps://www.privacyshield.gov/participant?id=a2zt0000000GnywAACyou can learn more about it. We have tried to bring you closer to the most important information about Instagram's data processing. On https://help.instagram.com/519522125107875 you can take a closer look at Instagram's data policies.

Our promise: With us, you are guaranteed to be able to chat. Registration and creating a profile are free, and many features are also free. You do not need to subscribe to a paid plan to use Hellovy. The minimum age for using Hellovy is 18 years. Hellovy is optimized for desktop, mobile phones, and tablets. Hellovy offers a partially moderated chat for men and women seeking a flirtatious and entertaining chat in a safe digital environment. Based on the chosen settings, users can receive suggestions from moderated profiles, with whom real encounters are not possible. Before using Hellovy, please read the terms and conditions, particularly the communication guidelines.
